

Luxurious Horsetrucks STX Horseboxes

 Energy. Anytime. Anywhere.

Hungary – ‘A competition horse can only perform well if it can enter the ring in top condition’, says the Belgian businessman and horse-lover Stephan Conter, owner of ‘Stephex Horseboxes’. This company builds luxurious horseboxes, for the professional transport of high-end horses. The trucks are equipped with electrical systems from Victron Energy.

Stephex Horseboxes (part of STX) started as a small Hungarian steel factory and has become a world-class horsebox manufacturer. For the top sector, a trailer towed by a heavy-duty Mercedes is part of a distant past. The horsetruck offers comfort and luxury for the horses and the crew. Inside the truck a complete living is realized, where the crew can relax, take a shower and sleep. In this way the horses and crew will arrive totally relaxed, refreshed and well-cared for, ready to achieve the best results.

The horsetruck from Stepdex Horseboxes are equipped with all amenities, for both man and horse. The trucks are available in different framework models, with space for 4 to 9 horses. The client indicates the exact level of luxury, comfort and design with which he would like to be surrounded. Everything is possible in the horsetrucks:

- a living space with all modern comforts; a U-shaped luxury sofa, the latest TV, audio and communication systems, task lighting and good access to the driving cabin
- a compact yet extensive designer kitchen with dishwasher, fridge-freezer and hot and cold running water
- bathroom with a luxury shower and toilet
- sleeping cabin

And for the care of the horses:

- comfortable, spacious stables with food and water
- plenty of daylight
- separate entry
- professional grooming equipment
- hydraulic lifting arm to store saddles

Equipment of Victron Energy

The on-board facilities and specifications demand quite a high amount of energy. During events the energy supply might be very limited or even absent, particularly during events held in remote locations. *‘Because everything turns on comfort, we only use materials of the highest specification’, Stephen says. That’s why they have chosen for a robust self-sufficient on-board energy system from Victron Energy.*

At the heart of the system a Quattro unit supplies 230 Volt and charges the batteries when mains power is available. When an energy-shortage threatens, the system automatically switches on the generator. The system works on the ‘plug and play’ principle.

STX

Beside horsetrucks, the company 'STX' is divided in two other sub-companies: 'Stephex Stables', a trading stable with international showjumpers, and 'Motorhomes STX', a company that produces trucks with a luxurious living. These Motorhomes are equipped with Victron Energy.
